SIMILARITY: Belongs to family 10 G-protein coupled receptors. Highest to other tachykinins receptors. CAUTION: Was originally (Ref.1) thought to be a kappa-type opioid receptor and to originate from human. Ref.2 showed that it is a tachikin receptor and was termed NX-4R. Ref.3 shows that it is a from guinea pig and is NX-3R.
                                                                                                                          SEQUENCE FROM N.A., AND SHOWS THAT IT IS NOT A HUMAN SEQUENCE. Page N.M., Bell N.J.; "The human tachykinin NK1 (short form) and tachykinin NK4 receptor: a

"The transcriptional co-activator p/CIP binds CBP and mediates
nuclear-receptor function.";
Nature 387:677-684(1997).
-!- FUNCTION: Acetyltransferase enzyme. Acetylates histones, giving a
specific tag for transcriptional activation. Also acetylates non-
histone proteins, like NCOA3 coactivator. Mediates CAMP-gene
regulation by binding specifically to phosphorylated CREB protein.
CBP, as coactivator, augments the activity of phosphorylated CREB
to activate transcription of CAMP-responsive genes (By
                                                                                                                                                                     "Phosphorylated CREB binds specifically to the nuclear protein CBP."; Nature 365:855-859(1993).
                                                                                                                                                                                                                                                          MEDLINE=97336097; PubMed=9192892;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               -!-STMIJARILY).
-! CATALVYTIC ACTIVITY: Acetyl-CoA + histone = CoA + acetyl-histone.
-!-SUBUNIT: Interacts with SMAD1, SMAD2, SMAD3, PCAF and PML. The
TAZ-type 1 domain interacts with HIF1A. Found in a complex
containing NCOA2; NCOA3; IKVA, IKVB and IKBKG. Interacts with
NCOA6 coactivator. Probably part of a complex with HIF1a and
EP300 (By similarity)
-!-SUBCELLULAR LOCATION: Nuclear.
-!-SIMILARITY: Contains 1 bromodomain.
-!-SIMILARITY: Contains 2 Z-type zinc fingers.
-!-SIMILARITY: Contains 2 TAZ-type zinc fingers.

Teneration and initial analysis of more than 15,000 full-length human and mouse cDNA sequences.",
The mouse CDNA sequences.",
The proc. Natl. Acad. Sci. U.S.A. 99:16899-16903(2002).
C. FUNCTION: Acts as a transcriptional repressor. Interacts with MXII
C. -- FUNCTION: Acts as a transcriptional repressor. Cocception of the heterodimer then represses transcription by tethering activities. Also interacts with MAD-MAX heterodimers by binding to MAD. The heterodimer then represses transcription by tethering C. -- SUBCELLULAR LOCATION: Nuclear (By similarity).
C. -- SUBCELLULAR LOCATION: Nuclear (By similarity).
C. -- SIMILARITY: Contains 3 PAH (paired amphipathic helix) repeats.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This SWISS-PROT entry is copyright. "I agged1, Jagged2 and Delta! to regulate cell-fate determination. Upon ligand activation through the released notch intracellular domain (NICD) it forms a transcriptional activator complex with RBP-J kappa and activates genes of the enhancer of split locus. Affects the implementation of differentiation, proliferation and appototic programs (By similarity). May play a role during CNS development.

Human ligands of the Norch receptor.";
Am. J. Pathol. 154:785-794(1999)
L. Am. FUNCTION: as a receptor for membrane-bound ligands
Jaggeda. Jaggeda and beltal to regulate cell-fate determination.
Upon ligand activates penes for the enhance complex with
RBP-J Kappa and activates genes of the enhance of split locus.
Affects the implementation of differentiation, proliferation and
apoptotic programs (By similarity).
C. SUBNIT: Heterodiams (B similarity).
C. SUBNIT: Heterodiams of a C-terminal fragment N(TM) and a N-
terminal fragment N(EC) which are probably linked by disulfide
C. SUBCELLULAR LOCATION: Type I membrane protein. Following
proteolytical processing NECD is translocated to the nucleus.
C. TISSUE SPECIFICITY: Ubiquitously expressed in fetal and adult
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     which is proteolytically cleaved by a furin-like convertase in the which is proteolytically cleaved by a furin-like convertase in the trans-Golgi network before it reaches the plasma membrane to yield an active, ligand-accessible form. Cleavage results in a C-terminal fragment N(TM) and a N-terminal fragment N(EC). Following ligand binding, it is cleaved by TMF-alpha converting enzyme (TACB) to yield a membrane-associated intermediate fragment called notch extracellular truncation (NEXT). This fragment is then cleaved by presentlin dependent gamma-secretase to release a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Lamerdin J.E., McCready P.M., Skowronski E., Adamson A.W.,

                                                                                                                notch-derived peptide containing the intracellular domain (NICD) from the membrane (By similarity).

-!- PTM: Phosphorylated (By similarity).

-!- DISBASE: Defects in NOTCH3 are associated with cerebral autosomal dominant arteriopathy with subcortical infarcts and leukoencephalopathy (CADASIL) [MIM:125310]. CADASIL causes a type of stroke and dementia of which key features include recurrent subcortical ischemic events and vascular dementia.
-!- SIMILARITY: Belongs to the NOTCH family.
-!- SIMILARITY: Contains 34 EGF-like domains.
-!- SIMILARITY: Contains 5 ANK repeats.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         EMBL, AFOSBB01, AAC14346.1, ---

"Mena is required for neurulation and commissure formation.";
Neuron 22:313-325(1999).
-!- FUMCTION: May be involved in microfilament assembly and cell
motility. Induces the formation of F-actin rich outgrowths in
fibroblasts. Required for neurulation and commissure formation.
-!- SUBCILULAR LOCATION: Localized to focal adhesions and, to a
lesser extent, leading edges and stress fibers.
-!- ALTERNATIVE PRODUCTS:

FUNCTION: Hyperpolarization-activated ion channel exhibiting weak selectivity for potassium over sodium ions. Contributes to the native pacemaker currents in heart (1f) and in neurons (1h).

Produces a large instantaneous current. Activated by cAMP.

Produces a large instantaneous current. Activated by cAMP.

Produces a large instantaneous current. Activated by cAMP.

C. Insuration to more negative voltages (By similarity).

C. SUBMINIT: The potassium channel is probably composed of a homo- or with HCNI. Interacts with KCNE2 (By similarity).

C. SUBCELDIAR LOCATION: Integral membrane protein.

C. DOMAIN: The segment S4 is probably the voltage-sensor and is characterized by a series of positively charged amino acids at every third position.

C. MISCELLANBOUS: Inhibited by extracellular cesium ions.

SIMILARITY: Belongs to the potassium channel family. HCN

SUMILARITY: Belongs to the potassium channel family.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                            -!- FUNCTION: Potential Ras effector protein. May function as a guantine nucleotide exchange (GBF), by exchanging bound GDF for free GTP (By similarity).
-!- SUBDNIT: Interacts with RABEB (By similarity).
-!- SUBLNIT: Belongs to the RIN (Ras interaction/interference)

-:- TISSUE SPECIFICITY: During development it is expressed in subregions of the nervous system and is particularly prominent in muscle. In adulthood, it is expressed ubiquitously.
-:- SIMILARITY: Belongs to the semaphorin family.
-:- SIMILARITY: Contains 1 Sema domain.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Description

of the alternative transcript is a truncated HER-2 protein designated BGHER-2 which lacks the transmembrane and intracellular domains of p185HER-2 but contains ECD i. I of the p185HER-2 and the novel ECDIII. The ECDIIIA-containing polypeptides bind tightly to, and thus antagonise the ECDIIIA-containing polypeptides bind tightly to, and thus antagonise nucleic acids encoding these are useful to treat, diagnose and identify solid tumours. The present sequence is human p68HER-2 generic protein shown in the specification but is derived from p68HER-2 generic sequence (SEQ ID NO:2) shown in the sequence listing (AAB09181)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          361 GPAHPVLSFLRPSWDLVSAFYSLPLAPLSPTSVPISPVSVGRGPDPDAHVAVNLSRYEG 419
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               /note= "Represented as Agn in the parent sequence shown in the specification"

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to novel HER-2 (herstatin-2) antagonist particularly a polypeptide that binds to the extracellular domain (ECD) of HER-2 at a site that is different from the binding site of humanised antibody, Herceptin, at an affinity of at least 10°8. The present invention is based upon the initial discovery of an alternative HER-2 mRNA transcript with 274 bp insert of intron 8. The translation product

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to novel HER-2 (herstatin-2) antagonist

particularly a polypeptide that binds to the extracellular domain (ECD)

of HER-2 at a site that is different from the binding site of humanised

antibody, Herceptin, at an affinity of at least 10'8. The present

invention is based upon the initial discovery of an alternative HER-2

mRNM transcript with 274 bp insert of intron 8. The translation product

of the alternative transmential at runoated HER-2 protein designated

p68HER-2 which lacks the transmembrane and intracellular domains of

the HER-2 but cortains ECD I II of the p18HER-2 and the novel ECDIIIa.

The ECDIIIA-containing polypeptides bind tightly to, and thus antagonise

the HER-2 receptor. The peptides wild to are HER-2 ECD, and the

nucleic acids encoding these are useful to treat, diagnose and identify

solid tumours. The present sequence is human p68HER-2 generic protein

shown in the specification but is derived from p68HER-2 generic sequence

(SEQ ID NO:2) shown in the sequence listing (AAE09181)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New polypeptide, which binds to the extracellular domain of HER-2 for the treatment of hard tumors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           9

                                                                                                                                                             Region
The invention relates to novel HER-2 (herstatin-2) aniagonist particularly a polypeptide that binds to the extracellular domain (ECD) of HER-2 at a site that is different from the binding site of humanised antibody. Herceptin, at an affinity of at least 10°8. The present intody, Herceptin, at an affinity of at least 10°8. The present invention is based upon the initial discovery of an alternative HER-2 mRNA transcript with 274 bp insert of intron 8. The translation product of the alternative transmembrane and intracellular domains of p185HER-2 but contains ECD I II of the p185HER-2 and the novel ECDIII. The ECDIIIA-containing PCD I II of the p185HER-2 and thus antagonise the ECDIIIA-containing PCD I II of the p185HER-2 and thus antagonise the ECDIIIA-containing PCD I II of the p185HER-2 and thus antagonise the ECDIIIA-containing PCD I I of the p185HER-2 generic protein solid tumours. The present sequence is human p68HER-2 generic protein containing ECDIIIA variant sequence is human p68HER-2 generic sequence is hown in the specification but is derived from p68HER-2 generic sequence (SEQ ID NO:2) shown in the sequence listing (AAEO9181)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  180

extracellular domain of HER-2 for the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to novel HER-2 (herstatin-2) antagonist particularly a polypeptide that binds to the extracellular domain (ECD) of HER-2 at a site that is different from the binding site of humanised antibody, Herceptin, at an affinity of at least 10 %. The present invention is based upon the initial discovery of an alternative HER-2 mRNA transcript with 274 bp insert of intron %. The translation product of the alternative transcript is a truncated HER-2 protein designated p68HER-2 which lacks the transmembrane and intracellular domains of
                                                                                                                                                                                                                                                                                                                          New polypeptide, which binds to the treatment of hard tumors.
                                                                                                                                                             Evans A;
                                                                                                                                                                                                                                                                                                                                                                                                                                                    Example 11; Page; 61pp; English.

AAE09207
ID AAE0

p185HER-2 but contains ECD I, II of the p185HER-2 and the novel ECDIIIa. The ECDIIIA. containing polypeptides bind tightly to, and thus antagonise the HER-2 receptor. The peptides, which bind to an HER-2 ECD, and the nucleic acids encoding these are useful to treat, diagnose and identify solid tumours. The present sequence is human p68HER-2 generic protein containing ECDIIIa variant sequence. Note: The present sequence is not shown in the specification but is derived from p68HER-2 generic sequence (SEQ ID NO:2) shown in the sequence listing (AAE09181) 8888888888888

                                                 The present invention relates to a method for treating a solid tumour characterised by endothelial growth factor receptor (EGPR) expression. The method involves administering an agent that binds to an extracellular domain (ECD) of EGFR. The invention also relates to a naturally occurring inhibitor of HER-2 receptor tyrcsine kinase called herstatin. The corpression of herstatin with plashERZ causes a striking reduction in cell growth that corresponds with suppression of plas autophosphorylation. The method or a pharmaceutical composition is useful for treating a solid cumour (selected from gramous cell carcinoma, lung carcinoma, colon carcinoma and glial cell tumour) characterised by EGFR expression. The present sequence is human truncated HERZ protein that lacks transmembrane

extracellular domain of the endothelial growth factor receptor

Claim 1; Page 78-80; 82pp; English.

Ç

```
New polypeptide, which binds to the extracellular domain of HER-2 for the treatment of hard tumors.
                                 shown

Example 11, Page, 61pp, English.

The invention relates to novel HER-2 (herstatin-2) antagonist particularly a polypeptide that binds to the extracellular domain (ECD) of HER-2 at a site that is different from the binding site of humanised antibody, Herceptin, at an affinital discovery of an alternative HER-2 invention is based upon the initial discovery of an alternative HER-2 mRNA transcript with 274 bp insert of introm 8. The translation product of the alternative transmembrane and intracellular domains of pi85HER-2 but contains ECD I, II of the p185HER-2 rotein designated p68HER-2 but contains polypeptides bind tightly to, and thus antagonise the HER-2 receptor. The peptides, which bind to an HER-2 ECD and the nucleic acids encoding these are useful to treat, diagnose and identify solid tumours. The present sequence is human p68HER-2 generic protein containing BCDIII sequence. Note: The present sequence is not shown in the specification but is derived from p68HER-2 generic sequence (SEQ ID NO:2) shown in the sequence listing (AAB09181)

              RESULT 9
                                        The invention relates to novel HER-2 (herstatin-2) antagonist particularly a polypeptide that binds to the extracellular domain (BCD) of HER-2 at a site that is different from the binding site of humanised antibody, Herceptin, at an affinity of at least 10.8. The present invention is based upon the initial discovery of an alternative HER-2 many transcript with 274 bp insert of intron 8. The translation product of the alternative transmembrane and intracellular domains of pBHER-2 but contains BCD I. Il of the p185HER-2 and the novel BCDIIIa. The ECDIIIA-containing polypeptides bind tightly to, and thus antagonise the ECDIIIA-containing polypeptides bind tightly to, and thus antagonise contains are sevent as a second of the novel BCDIII containing BCDIII and the sequence is human p68HER-2 generic protein shown in the specification but is derived from p68HER-2 generic sequence (SEQ ID NO:2) shown in the sequence listing (AAE09181)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New polypeptide, which binds to the extracellular domain of HER-2 for the treatment of hard tumors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           180

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   300
antibody, Herceptin, at an affinity of at least 10°8. The present invention is based upon the initial discovery of an alternative HER-2 mRAN transcript with 274 bp insert of intron 8. The translation product of the alternative transcript is a truncated HER-2 procein designated p58HER-2 which lacks the transmembrane and intracellular domains of p188HER-2 which lacks the transmembrane and intracellular domains of p188HER-2 but contains BCD I, II of the p188HER-2 and the novel ECDIIIa. The ECDIIIA-containing polypeptides bind tightly to, and thus antagonise the HER-2 receptor. The peptides, which bind to an HER-2 ECD, and the nucleic acids encoding these are useful to treat, diagnose and identify solid tunours. The present sequence is human p68HER-2 generic protein containing ECDIIIa variant sequence. Note: The present sequence is not shown in the specification but is derived from p68HER-2 generic sequence (SEQ ID NO:2) shown in the sequence listing (AAE09181)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         YNYLSTDVGSCTLVCPLHNQEVTABDGTQRCEKCSKPCARGTHSLLPRPAAVPVPLRMQP 360

The ECDIIIA-containing polypeptides bind tightly to, and thus antagonise the HER-2 receptor. The peptides, which bind to an HER-2 ECD, and the models caids encoding these are useful to treat, diagnose and identify soll immorts. The present sequence is human p68HER-2 protein containing

of HER-2 at a site that is different from the binding site of humanised articularly a polypeptide that binds to the extracellular domain (ECD) of HER-2 at a site that is different from the binding site of humanised at landy, Herceptin, at an affinity of at least 10% The present invention is based upon the initial discovery of an alternative HER-2 mena transcript with 274 bp insert of intron 8. The translation product of the alternative transcript is a truncated HER-2 protein designated of BHBRR-2 which lacks the transmembrane and intracellular domains of p185HER-2 which lacks the transmembrane and intracellular domains of p185HER-2 but contains BCD I, II of the p185HER-2 and the novel ECDIIIa. The HER-2 receptor. The peptides bind tightly to, and thus antagonise the HER-2 receptor. The peptides, which bind to an HER-2 ECD, and then outlet acids encoding these are useful to treat, diagnose and identify solid tumours. The present sequence is human p68HER-2 generic protein containing BCDIIIa variant sequence. Note: The present sequence is not shown in the specification but is derived from p68HER-2 generic sequence is not shown in the sequence listing (AAB09181)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

The invention relates to novel HER-2 (herstatin-2) antagonist particularly a polypeptide that binds to the extracellular domain (ECD) of HER-2 at a site that is different from the binding site of humanised artibody, Herceptin, at an affinity of at least 10.8. The present invention is based upon the initial discovery of an alternative HER-2 mRNA transcript with 274 bp insert of intron 8. The translation product of the alternative transcript is a truncated HER-2 protein designated p68HER-2 which lacks the transmembrane and intracellular domains of p185HER-2 but contains ECD I, II of the p185HER-2 and the novel ECDIIIa. The HER-2 receptor. The peptides bind tightly to, and thus antagonise the HER-2 receptor. The peptides which bind to an HER-2 ECD, and the nucleic acids encoding these are useful to treat, diagnose and identify solid tumours. The present sequence is human p68HER-2 generic protein containing ECDIIIa variant sequence. Note: The present sequence is not shown in the specification but is derived from p68HER-2 generic sequence is not shown in the sequence listing (AAE09181)
New polypeptide, which binds to the extracellular domain of HER-2 for the treatment of hard tumors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           180
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        240
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                300

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to novel HER-2 (herstatin-2) antagonist particularly a polypeptide that binds to the extracellular domain (BCD) of HER-2 at a site that is different from the binding site of humanised irribody, Herceptin, at an affinity of at least 10.8. The present irribody, Herceptin, at an affinity of at least 10.8. The present irribody, Herceptin, at an affinity of at least 10.8. The present irribody, Herceptin, at an affinity of at least 10.8. The present of invention is based upon the initial discovery of an alternative HER-2 mRNA transcript with 274 bp insert of intron 8. The translation product of the alternative transmembrane and intracellular domains of pl85HER-2 but containing polypeptides bind tightly to, and thus antagonise the HER-2 receptor. The peptides, which bind to an HER-2 containing these are useful to treat, diagnose and identify solid tumours. The present sequence is human p68HER-2 generic protein containing BCDIIIa variant sequence. Note: The present sequence is not shown in the specification but is derived from p68HER-2 generic sequence (SEQ ID NO:2) shown in the sequence listing (AAE09181)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New polypeptide, which binds to the extracellular domain of HER-2 for the treatment of hard tumors.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to novel HER-2 (herstatin-2) antagonist particularly a polypeptide that binds to the extracellular domain (ECD) of HER-2 at a site that is different from the binding site of humanised antibody, Herceptin, at an affinity of at least 10.8. The present invention is based upon the initial discovery of an alternative HER-2 mRNA transcript with 274 bp insert of intron 8. The translation product of the alternative transcript is a truncated HER-2 protein designated p58HER-2 but contains ECD I, II of the p185HER-2 and the novel ECDIIIa. The ECDIIIA-containing polypeptides bind tightly to, and thus antagonise the HER-2 receptor. The peptides, which bind to an HER-2 ECD, and the nucleic acids encoding these are useful to treat, diagnose and identify solid tumours. The present sequence is human p68HER-2 generic protein containing ECDIIIa sequence. Note: The present sequence is not shown in the specification but is derived from p68HER-2 generic sequence is not shown in the sequence listing (AABO9183)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New polypeptide, which binds to the extracellular domain of HER-2 for the treatment of hard tumors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           120

The invention relates to novel HER-2 (herstatin-2) antagonist particularly a polypeptide that binds to the extracellular domain (ECD) of HER-2 at a polypeptide that is different from the binding site of humanised antibody, Herceptin, at an affinity of at least 10.8. The present invention is based upon the initial discovery of an alternative HER-2 mRNA transcript with 274 bp insert of intron 8. The translation product of the alternative transcript is a truncated HER-2 protein designated of the alternative transcript is a truncated HER-2 protein designated of HER-2 but contains ECD I. Il of the ploSHER-2 and the novel ECDIII. The ECDIIIA-containing polypeptides bind tightly to, and thus antagonise the ECDIIIA-containing polypeptides bind tightly to, and thus antagonise the ECDIIIA-containing polypeptides, which bind to an HER-2 ECD, and the noveled a cids encoding these are useful to treat, diagnose and identify solid tumours. The present sequence is human p68HER-2 generic protein shown in the specification but is derived from p68HER-2 generic sequence (SEQ ID NO:2) shown in the sequence listing (AAE09181) polypeptide, which binds to the extracellular domain of HER-2 for the $trment\ of\ hard\ tumors.$ Example 12; Page; 61pp; English Evans WPI; 2001-529934/58 Clinton G,

New polypeptide, which binds to the extracellular domain of HER-2 for the treatment of hard tumors.

The invention relates to novel HER-2 (herstatin-2) antagonist particularly a polypeptide that binds to the extracellular domain (ECD) of HER-2 at a site that is different from the binding site of humanised antibody. Herceptin, at an affinity of at least 10 %. The present invention is based upon the initial discovery of an alternative HER-2 mink transcript with 274 bp insert of intron 8. The translation product of the alternative transmembrane and intracellular domains of p8HER-2 which lacks the transmembrane and intracellular domains of the ECDIIIA-containing polypeptides bind tightly to, and thus antagonise the HER-2 receptor. The peptides bind tightly to, and thus antagonise the HER-2 receptor. The peptides which bind to an HER-2 ECD, and the uncleic acids encoding these are useful to treat diagnose and identify solid tumours. The present sequence is human p68HER-2 generic protein containing ECDIII variant sequence. Note: The present sequence is not

shown in the specification but is derived from p68HER-2 generic sequence (SEQ ID NO:2) shown in the sequence listing (AAE09181) 8838
